

I'M A NATIVE NEW YORKER

EARLY GOLDENROD

(Solidago juncea)

Description: Perennial, grows to 4 ft. Dusky green leaves grow smaller as they climb up the stem. Wand of tiny golden yellow flowers in showy clusters in late summer.

Culture: In the wild, it grows in dry fields and along roadsides. In your garden, does well in sunny, dry, nutrient poor soils. Very rich soils will discourage the plant from remaining upright.

Ecology: Excellent food source for caterpillars and nectar source for the adult butterflies and other insects. Seeds are eaten by various songbirds. A common wildflower in NYC.
